

Particle Emitters

The **Particle Emitter** component emits logical particles into the system. You can determine how individual particles will look like and how they are emitted. Many of the properties have *variation* counterparts, such as **Color variation**, for adding variation to the particles.

The **Trail Emitter** component emits particles from the location of other logical particles. Any logical particle of the followed component within the bounds of a trail emitter will cause particle emission from its location, as if there were an emitter on it with the same properties as the trail emitter.

Emitter components can use instances of the [Particle Shape](#) or [Model Shape](#) component to emit particles from the surface of the selected shape.

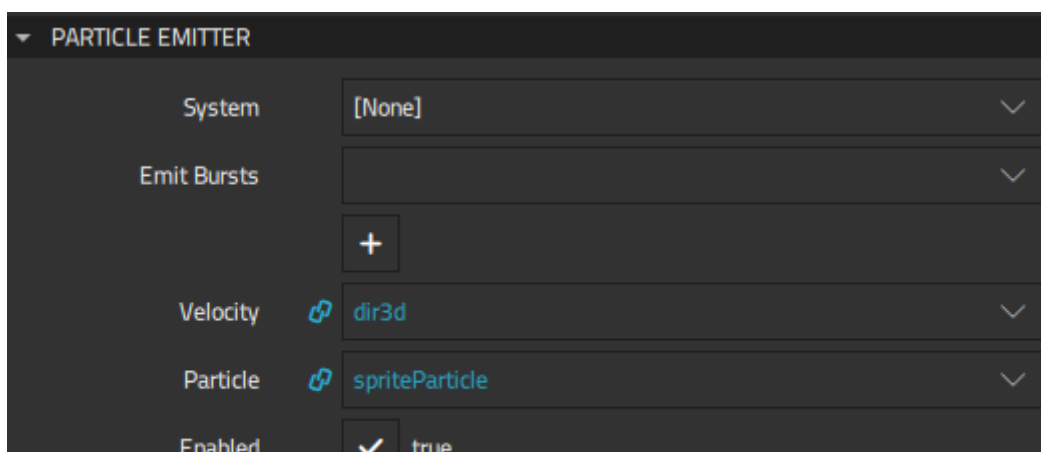

You always need one emitter. If the **Particle System** component instance is the direct parent of the emitter component instance, you don't need to specify the particle system separately. However, you always need to select the logical particle to emit, or nothing is emitted.

The following components are available for emitting particles:

- > [Emitter](#)
- > [Trail Emitter](#)
- > [Emit Burst](#)
- > [Model Shape](#)
- > [Particle Shape](#)

Emitter

Specify properties for particle emitters in **Properties > Particle Emitter**. You need at least one emitter.

Emit Rate	10.00
Life Span	1000
Life Span Variation	100
Particle Scale	1.00
Particle End Scale	1.50
Particle Scale Variation	0.00
Particle End Scale Va...	-1.00
Depth Bias	0.00

Emitter emits **logical particles** that you select in **Particle**, as defined by the other properties. If the **Particle System** component instance is not the direct parent of the emitter component instance, you need to select it in **System**.

You can control the amount of particles emitted per second by setting the value of **Emit rate** or add **Emit Burst** component instances in **Emit bursts** to emit bursts of specified amounts of particles at the specified point in time for the specified duration.

In **Velocity**, set a starting velocity for emitted particles. If velocity is not set, particles start motionless, and velocity is determined by **particle affectors**.

Use **Enabled** to turn an emitter on or off. Usually, this property is used in code to conditionally turn emitters on and off. To continue emitting bursts, set **Emit rate** to 0 instead of disabling **Enabled**.

In **Shape**, select the instance of the **Particle Shape** or **Model Shape** component to use. The shape is scaled, positioned, and rotated based on the emitter node properties. When the shape **Fill** property is set to false, particles are emitted only from the surface of the shape. When the shape is defined, it is visualized in the **3D** view. When the shape is not defined, particles are emitted from the center point of the emitter.

In **Life span**, specify the lifespan of a single particle in milliseconds. Specify variation in the particle lifespan in **Life span variation**. For example, to emit particles that will exist from three to four seconds, set **Life span** to 3500 ms and **Life span variation** to 500 ms.

Particle scale and **Particle end scale** specify the scale multiplier of the particles at the beginning and end. For variation in particle size, specify values for **Particle scale variation** and **Particle end scale variation**.

Depth bias specifies the the depth bias of the emitter. Depth bias is added to the object's distance from camera when sorting objects. This can be used to force the rendering order of objects that are located close to each other if it might otherwise change between frames. Negative values cause the sorting value to move closer to the camera while positive values move it further from the camera.

Trail Emitter

Specify additional properties for particle trail emitters in **Properties > Particle Trail Emitter**.

Select the logical particle component to follow in **Follow**.

Particle Rotation

Specify properties for the rotation of particles in **Properties > Particle Rotation**

Rotation	<input type="text" value="0.00"/>	X
	<input type="text" value="0.00"/>	Y
	<input type="text" value="0.00"/>	Z
Variation	<input type="text" value="180.00"/>	X
	<input type="text" value="180.00"/>	Y
	<input type="text" value="180.00"/>	Z
Velocity	<input type="text" value="0.00"/>	X
	<input type="text" value="0.00"/>	Y
	<input type="text" value="0.00"/>	Z
Velocity Variation	<input type="text" value="200.00"/>	X
	<input type="text" value="200.00"/>	Y
	<input type="text" value="200.00"/>	Z

Rotation specifies the rotation of the particles in the beginning. Rotation is defined as degrees in euler angles. For variation in rotation, specify values for **Variation**.

Velocity specifies the rotation velocity of the particles in the beginning. Rotation velocity is defined as degrees per second in euler angles. For variation in velocity, specify values in **Velocity variation**.

Emit Burst

Specify properties for emit bursts in **Properties > Emit Burst**.

▼

PARTICLE EMIT BURST

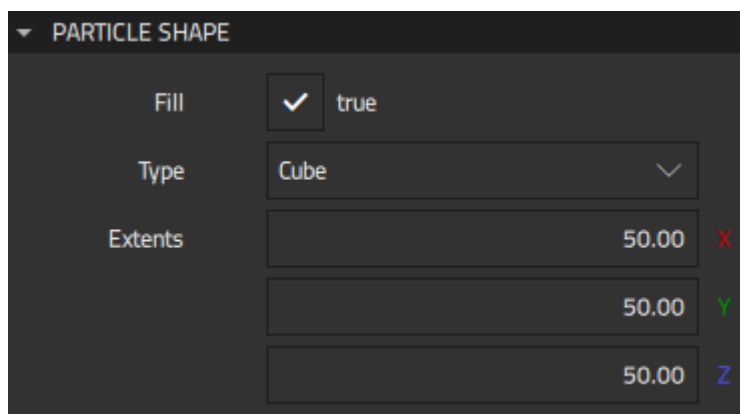

Time	<input type="text" value="2000"/>
Amount	<input type="text" value="50"/>
Duration	<input type="text" value="200"/>

Time specifies the time in milliseconds when emitting the burst starts, and **Amount** specifies the amount of particles emitted during the time specified in milliseconds in **Duration**.

For example, you could use two **Emit Burst** instances to emit 100 particles at the beginning and 50 particles at 2 seconds, so that both bursts take 200 milliseconds. For one instance, set **Time** to 0, **Amount** to 100, and **Duration** to 200. For the other instance, set **Time** to 2000, **Amount** to 50, and **Duration** to 200.

Particle Shape

Specify properties for particle shape in **Properties > Particle Shape**.

In **Type**, select the shape to use.

Select **Fill** to fill the shape instead of just displaying its outline.

Extents determines the extent coordinates of the shape geometry.

Model Shape

The **Model Shape** component specifies a template for defining the model.

Specify properties for model shape in **Properties > Particle Model Shape**.

In **Delegate**, select the **3D Model** component that defines each object instantiated by the particle.

Select **Fill** to fill the shape instead of just displaying its outline.
