If you have multiple projects loaded in a session, you can define the order in which they are built. For example, if project A depends on project B, project B must be built first.

Note: The build order is stored as a property of a session, not a project. You must open the session for these settings to take effect. For more information, see [Managing Sessions](#).

To define the build order of projects within a session:

1. Select **Projects > Project Settings > Dependencies**.
2. Select projects that must be built before the current project is built.
3. Select the **Synchronize configuration** check box to use the same kit as well as the same build and deploy configuration to build and deploy all dependent projects loaded in a session.

Qt Creator calculates the build order based on the dependencies that you specify for the projects loaded in the session.

Note: You cannot use this view to specify subprojects for projects. For more information on how to add subprojects, see [Adding Subprojects to Projects](#).
